SUMMARY

Dynamic Software Developer with 2+ years of experience in Python, React, and AI-driven app development. Key achievements include enhancing healthcare operations with AI algorithms and optimizing deployment pipelines. Skilled in delivering innovative solutions and improving user experiences.

WORK EXPERIENCE

Software Developer (Internship), Growing pAI, Brussels, Belgium

Jun 2024 – Sept 2024

- Objective : Parentia, the largest child benefit fund from Belgium needs an easy accessible knowledge base for their employees. This helps them to find information more easily while answering questions from customers. The backend needed to be versatile, as it had to answer both chat-based queries from employees and generate responses to emails.
- Achieved goals: I focused on the software development of the application in the python backend enabling the application to respond to both emails and chat-based inquiries. Then, I wrote a simple yet effective frontend to test the email tool internally and ensured a smooth release pipeline for the infrastructure.
- Technologies used: React.js, Python, CI/CD on Azure DevOps pipelines (Bicep), hosted on Azure, Azure Search, Azure Cognitive Services.

AI & Data Analyst (Freelance), UZ Brussel, Jette, Belgium

Oct 2022 – Feb 2023

- Objective: Develop an AI algorithm to analyze patient data and identify individuals requiring weight loss as part of their IVF preparation. Build a user-friendly web application for medical professionals to interact with the model.
- Achieved goals: Successfully designed and implemented an AI algorithm to process patient records and generate structured reports. Developed a React-based web application with a Python backend, ensuring seamless usability for doctors. Enabled medical professionals to create personalized health plans based on AI-driven insights.
- Technologies used: React.js, Python, Docker, Flask, CI/CD on Azure Devops (yaml), hosted on Azure

Software Developer (Freelance), Belsante Soins infirmiers, Brussels

Jan 2022 – Sept 2022

- Objective: Enhance user experience and streamline operations by developing full-stack mobile applications with cross-platform functionality, real-time tracking, secure transactions, and efficient data management.
- Achieved goals: Developed cross-platform mobile applications using React Native and Flutter.. Integrated real-time tracking and geolocation features to improve user engagement. Designed and implemented appointment scheduling systems for efficient time management. Managed dynamic databases with sensitive information, prioritizing security and regulatory compliance.
- Technologies used: React.js, Python, Flutter, Android Studio, Docker, Flask, CI/CD on Azure Devops (yaml), hosted on Azure

Software Engineering (Internship), Tripoli Governmental Hospital, Tripoli

Jan 2021 – Jul 2021

- Diagnosed and resolved system and network issues in one of Lebanon's largest hospitals, ensuring continuous operational functionality.
- Conducted routine safety assessments and upheld optimal IT system performance to support healthcare operations.

Engineering Lab Assistant, Rafic Hariri University, Meshref

Jan 2020 – Jun 2020

- Devised a prototype for automated homes using microcontrollers, showcasing innovative home technology solutions.
 - Integrated sensors into a solar panel tracking system and authored comprehensive documentation on home automation technologies.
-

EDUCATION

Master's in Applied Computer Sciences, Applied Sciences and Engineering, Vrije Universiteit Brussel, Brussels, Belgium

Sept 2022 – Jun 2024

Bachelor of Science, Computer and Communication Engineering, Rafik Hariri University, Beirut, Lebanon

Sept 2018 – Aug 2021

HOBBY PROJECTS(NEXT TO WORK/SCHOOL)

Portfolio

- I created a portfolio website using Angular to showcase my hobby projects. Feel Free to check it out: <https://mayoengin.github.io/mayoo/>

Movie Web App

- An React app showcasing recent movies. It serves as a project to explore and enhance Angular development skills.
- Technologies: React, TypeScript

MRI Detector AI

- Achieved 95% accuracy in tumor detection, improving diagnostic speed by using CNN-based AI with data augmentation
- Increased AI model performance by 20% by implementing advanced Python algorithms

ECG Classification Model

- A deep neural network with residual blocks (DNN-RB) that classifies ECG signals into six heartbeat types using the MIT-BIH Arrhythmia dataset.
- Implemented machine learning models improving efficiency by 20% using Python, TensorFlow, and Keras

Waldo Finder AI

- An AI project to locate Waldo using a model trained with triplet loss and binary classification techniques

CERTIFICATE

- AZ-204: Azure Developer Associate
- Udemy: Algorithm and Data Structure
- Udemy: Data Analytics and Healthcare

LANGUAGES

- Arabic (Fluent)
- English (Fluent)
- French (Advanced)

SKILLS

- Python
- CI/CD
- React Native
- Machine Learning
- Deep Learning
- HTML
- Java
- Arduino
- TensorFlow
- Angular
- Git
- Teamwork
- Communication
- Management Adaptability
- React.js
- Azure DevOps
- Flutter
- Data Structures
- SQL
- CSS
- JavaScript
- Node.js
- Keras
- TypeScript
- GitHub
- Problem-solving
- Project
